topics

1. Spherical Coordinate systems

Recap

Recap

A scalar quantity has only **magnitude**.
 A vector quantity has both **magnitude** and **direction**.

Scalar Quantities

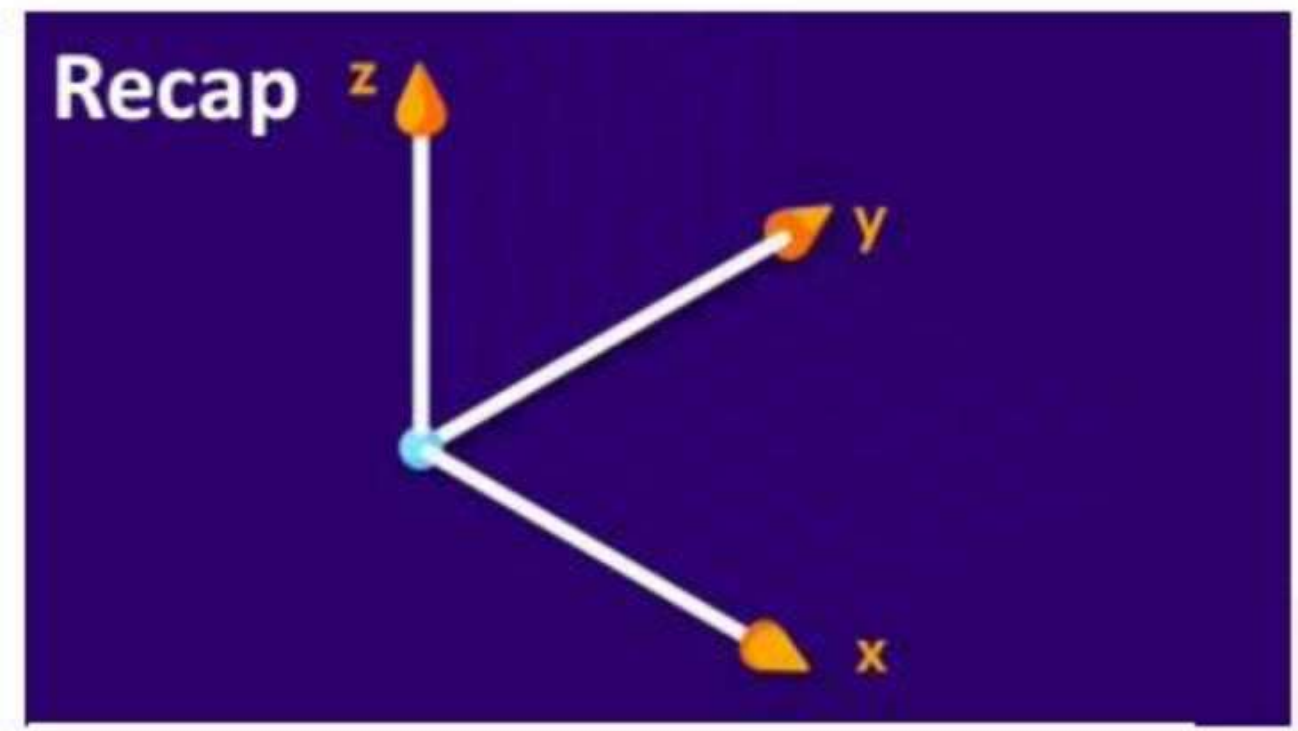

- length, area, volume
- speed
- mass, density
- pressure
- temperature
- energy, entropy
- work, power

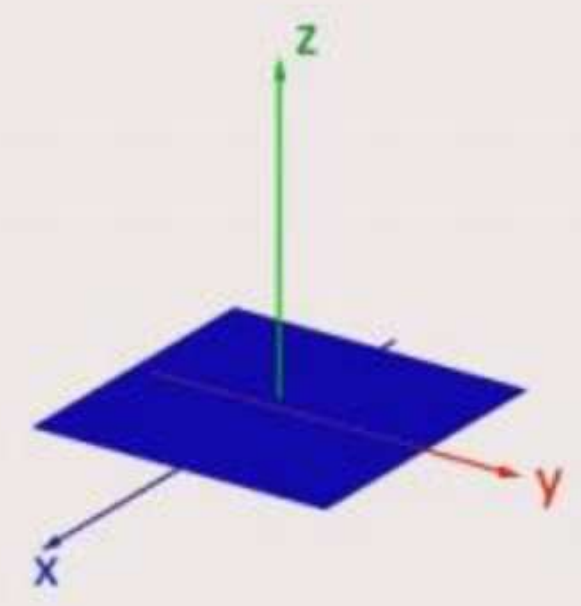

Vector Quantities

- displacement
- velocity
- acceleration
- momentum
- force
- lift, drag, thrust
- weight

Cylindrical Coordinate System

Cylindrical Coordinate System

z

Constant r surface

$$R \geq 0^\circ$$

y

x

Cylindrical Coordinate System

Constant z surface

$$-\infty \leq z \leq +\infty$$

Cylindrical Coordinate System

Cylindrical coordinate system planes

Q. If \vec{a} and \vec{b} are two arbitrary vectors with magnitudes a and b , respectively, $|\vec{a} \times \vec{b}|^2$ will be equal to

(a) $a^2b^2 - (\vec{a} \cdot \vec{b})^2$
 (b) $ab - \vec{a} \cdot \vec{b}$
 (c) $a^2b^2 + (\vec{a} \cdot \vec{b})^2$
 (d) $ab + \vec{a} \cdot \vec{b}$

$\vec{a} \times \vec{b} = ab \sin \theta \hat{a}_n$
 $|\vec{a} \times \vec{b}| = ab \sin \theta$
 $|\vec{a} \times \vec{b}|^2 = a^2 b^2 \sin^2 \theta$ Ans
 $\vec{a} \cdot \vec{b} = ab \cos \theta$ $\sin^2 \theta = 1 - \cos^2 \theta$
 $|\vec{a} \times \vec{b}|^2 = a^2 b^2 (1 - \cos^2 \theta) = a^2 b^2 - a^2 b^2 \cos^2 \theta$
 $= a^2 b^2 - (\vec{a} \cdot \vec{b})^2$

Q. The angle between two unit - magnitude coplanar vectors P(0.866, 0.500, 0) and Q(0.259, 0.966, 0) will be

(a) 0°
 (b) 30°
 (c) 45°
 (d) 60°

$\theta = \cos^{-1} \left(\frac{0.866 \times 0.259 + 0.500 \times 0.966}{\sqrt{(0.866)^2 + (0.500)^2} \sqrt{(0.259)^2 + (0.966)^2}} \right)$
 $= \cos^{-1} \left(\frac{0.707}{1 \times 1} \right) = \cos^{-1} \left(\frac{1}{\sqrt{2}} \right) = 45^\circ$

$A(2, -3, 2)$
 $\vec{OA} = 2\hat{i} - 3\hat{j} + 2\hat{k}$
 $|\vec{OA}| = \sqrt{2^2 + (-3)^2 + 2^2} = \sqrt{17}$

Number of Questions covered-9

Q. For the parallelogram OPQR shown in the sketch, $\vec{OP} = a\hat{i} + b\hat{j}$ and $\vec{OR} = c\hat{i} + d\hat{j}$. The area of the parallelogram is.

(a) $ad - bc$
 (b) $ac + bd$
 (c) $ad + bc$
 (d) $ab - cd$

$\text{Area} = |\vec{A} \times \vec{B}|$
 $\vec{A} \times \vec{B} = \vec{OP} \times \vec{OR} = \begin{vmatrix} \hat{i} & \hat{j} & \hat{k} \\ a & b & 0 \\ c & d & 0 \end{vmatrix} = (ad - bc)\hat{k}$
 $\text{Area} = ad - bc$

Q. P, Q and R are three points having coordinates (3, -2, -1), (1, 3, 4), (2, 1, -2) in XYZ space, then the distance from point P to plane OQR (O being the origin of coordinate system) is given by

$\vec{OQ} \times \vec{OR} = \vec{X}$
 $\vec{OQ} = \hat{i} + 3\hat{j} + 4\hat{k}$
 $\vec{OR} = 2\hat{i} + \hat{j} - 2\hat{k}$
 $\vec{OQ} \times \vec{OR} = \vec{X}$

$\vec{OP} = 3\hat{i} - 2\hat{j} - \hat{k}$
 Distance = $\frac{|\vec{OP} \cdot \vec{X}|}{|\vec{X}|}$

Coordinate systems

today's
topics

1. Spherical Coordinate systems

Spherical Coordinates $P(r, \theta, \phi)$

r = Radius of the sphere passing through the Point and centered around the origin

$$0 \leq r < \infty$$

$r = 0$ [point at origin]

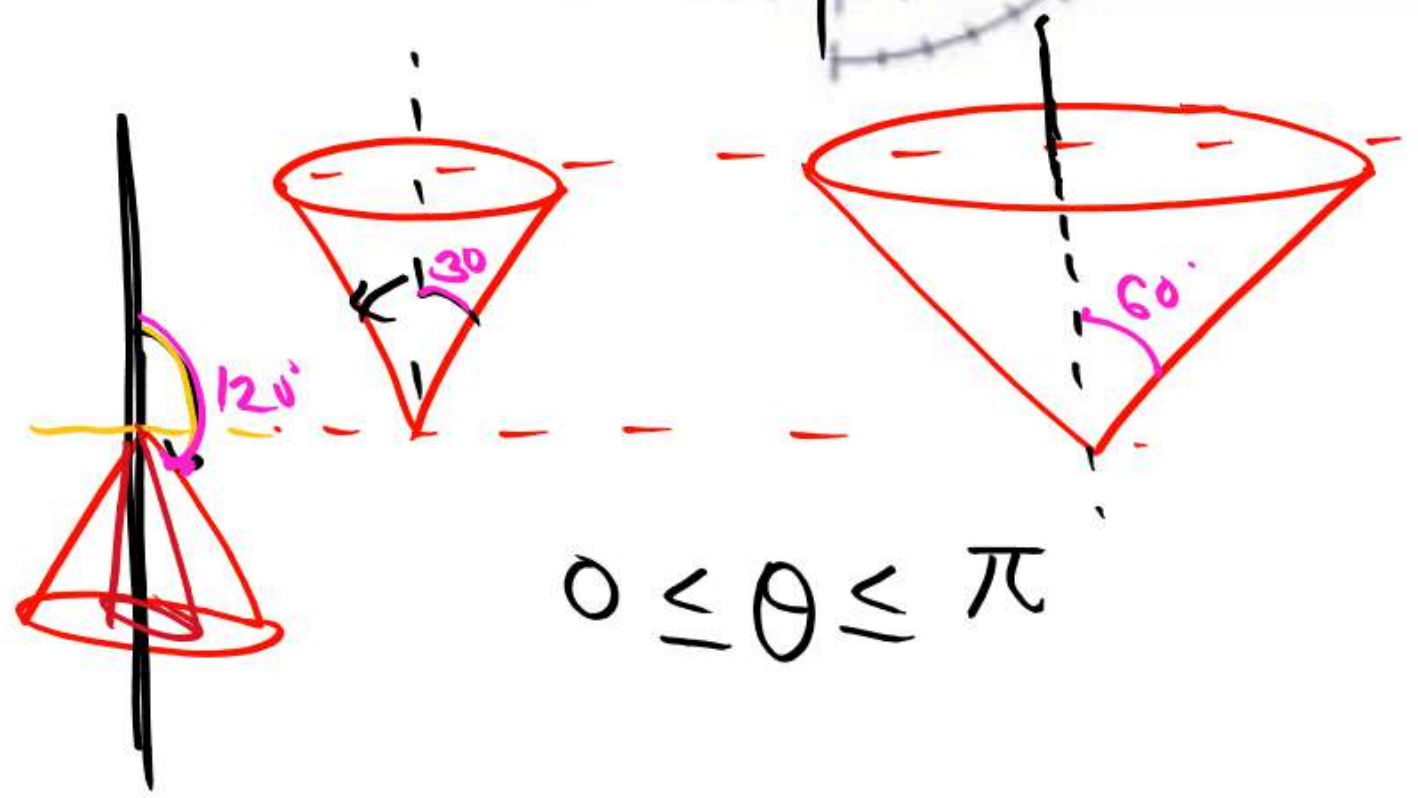

r = radial distance of point from origin.

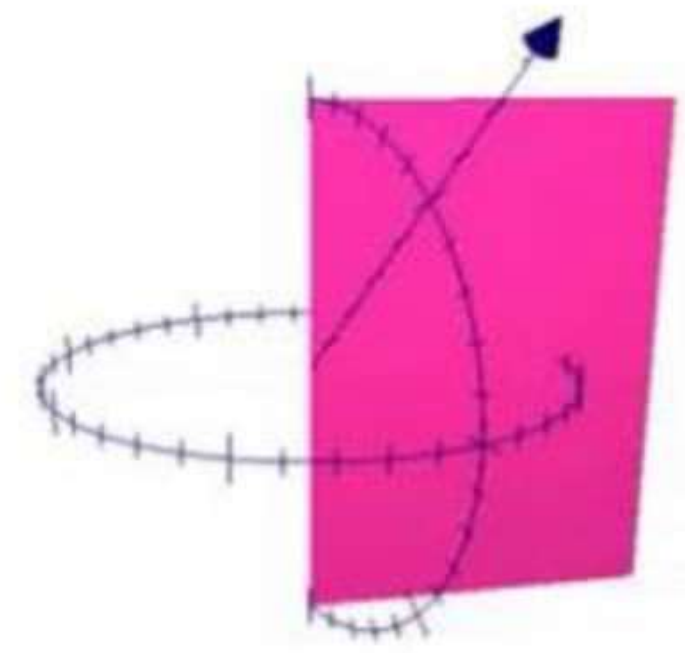

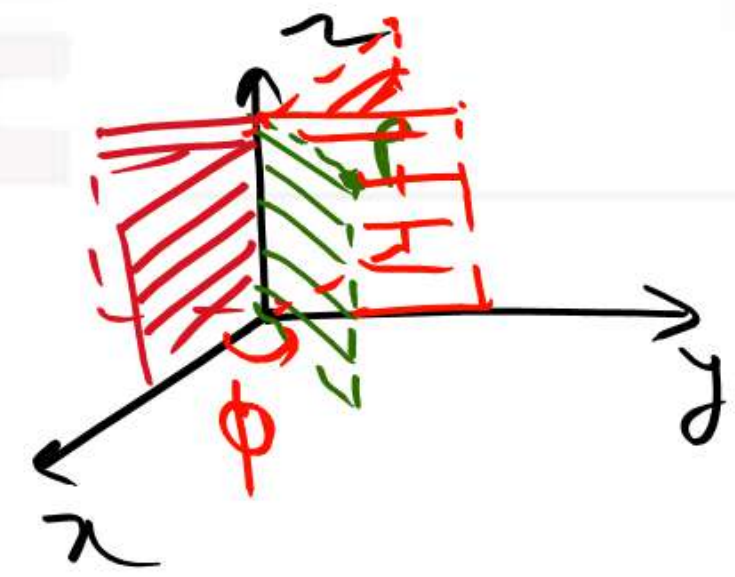

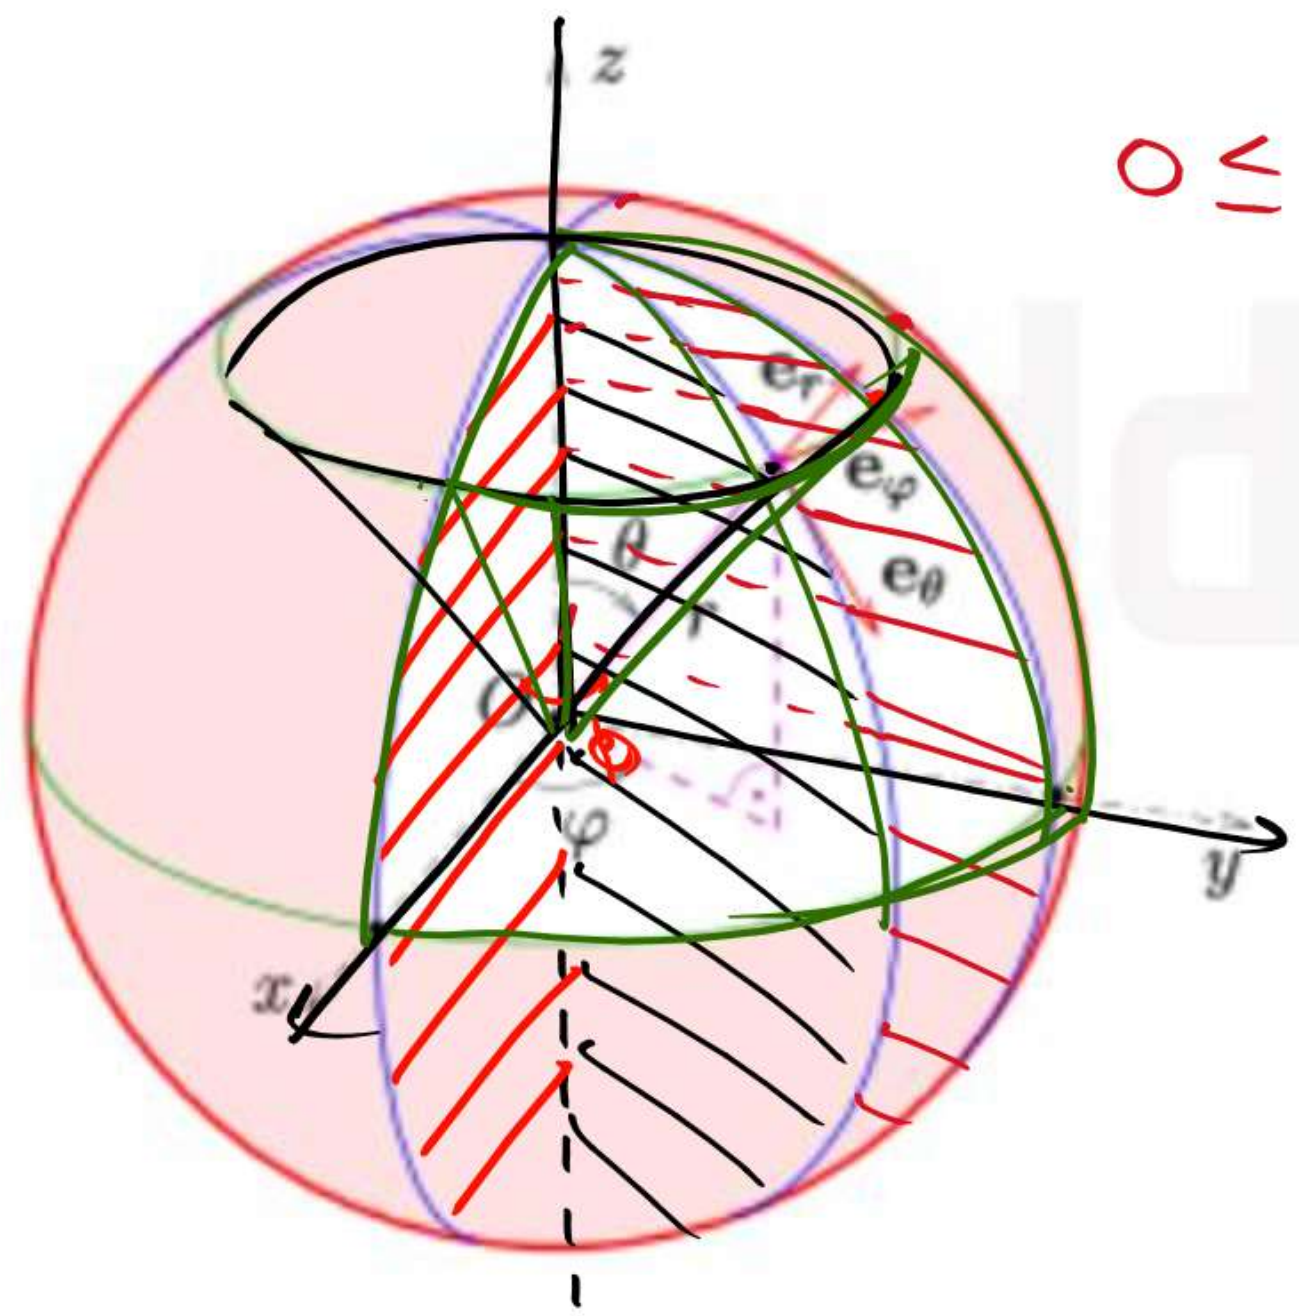

θ = Colatitude angle,
Tilt angle of cone passing through the
point and z-axis as central axis

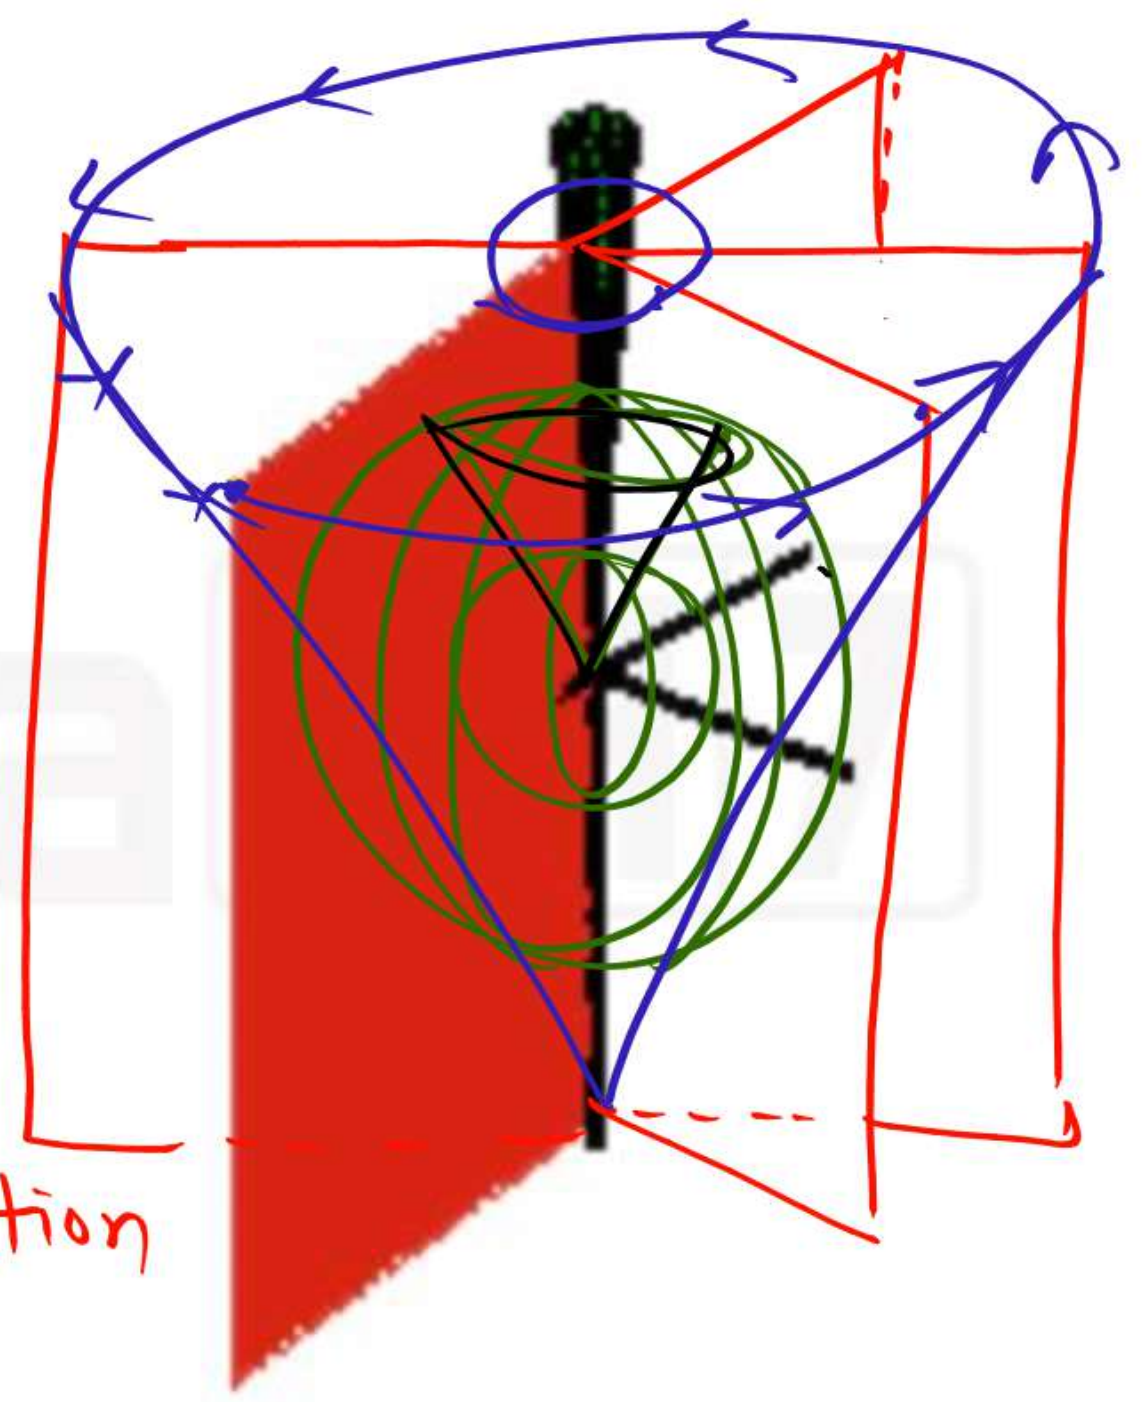

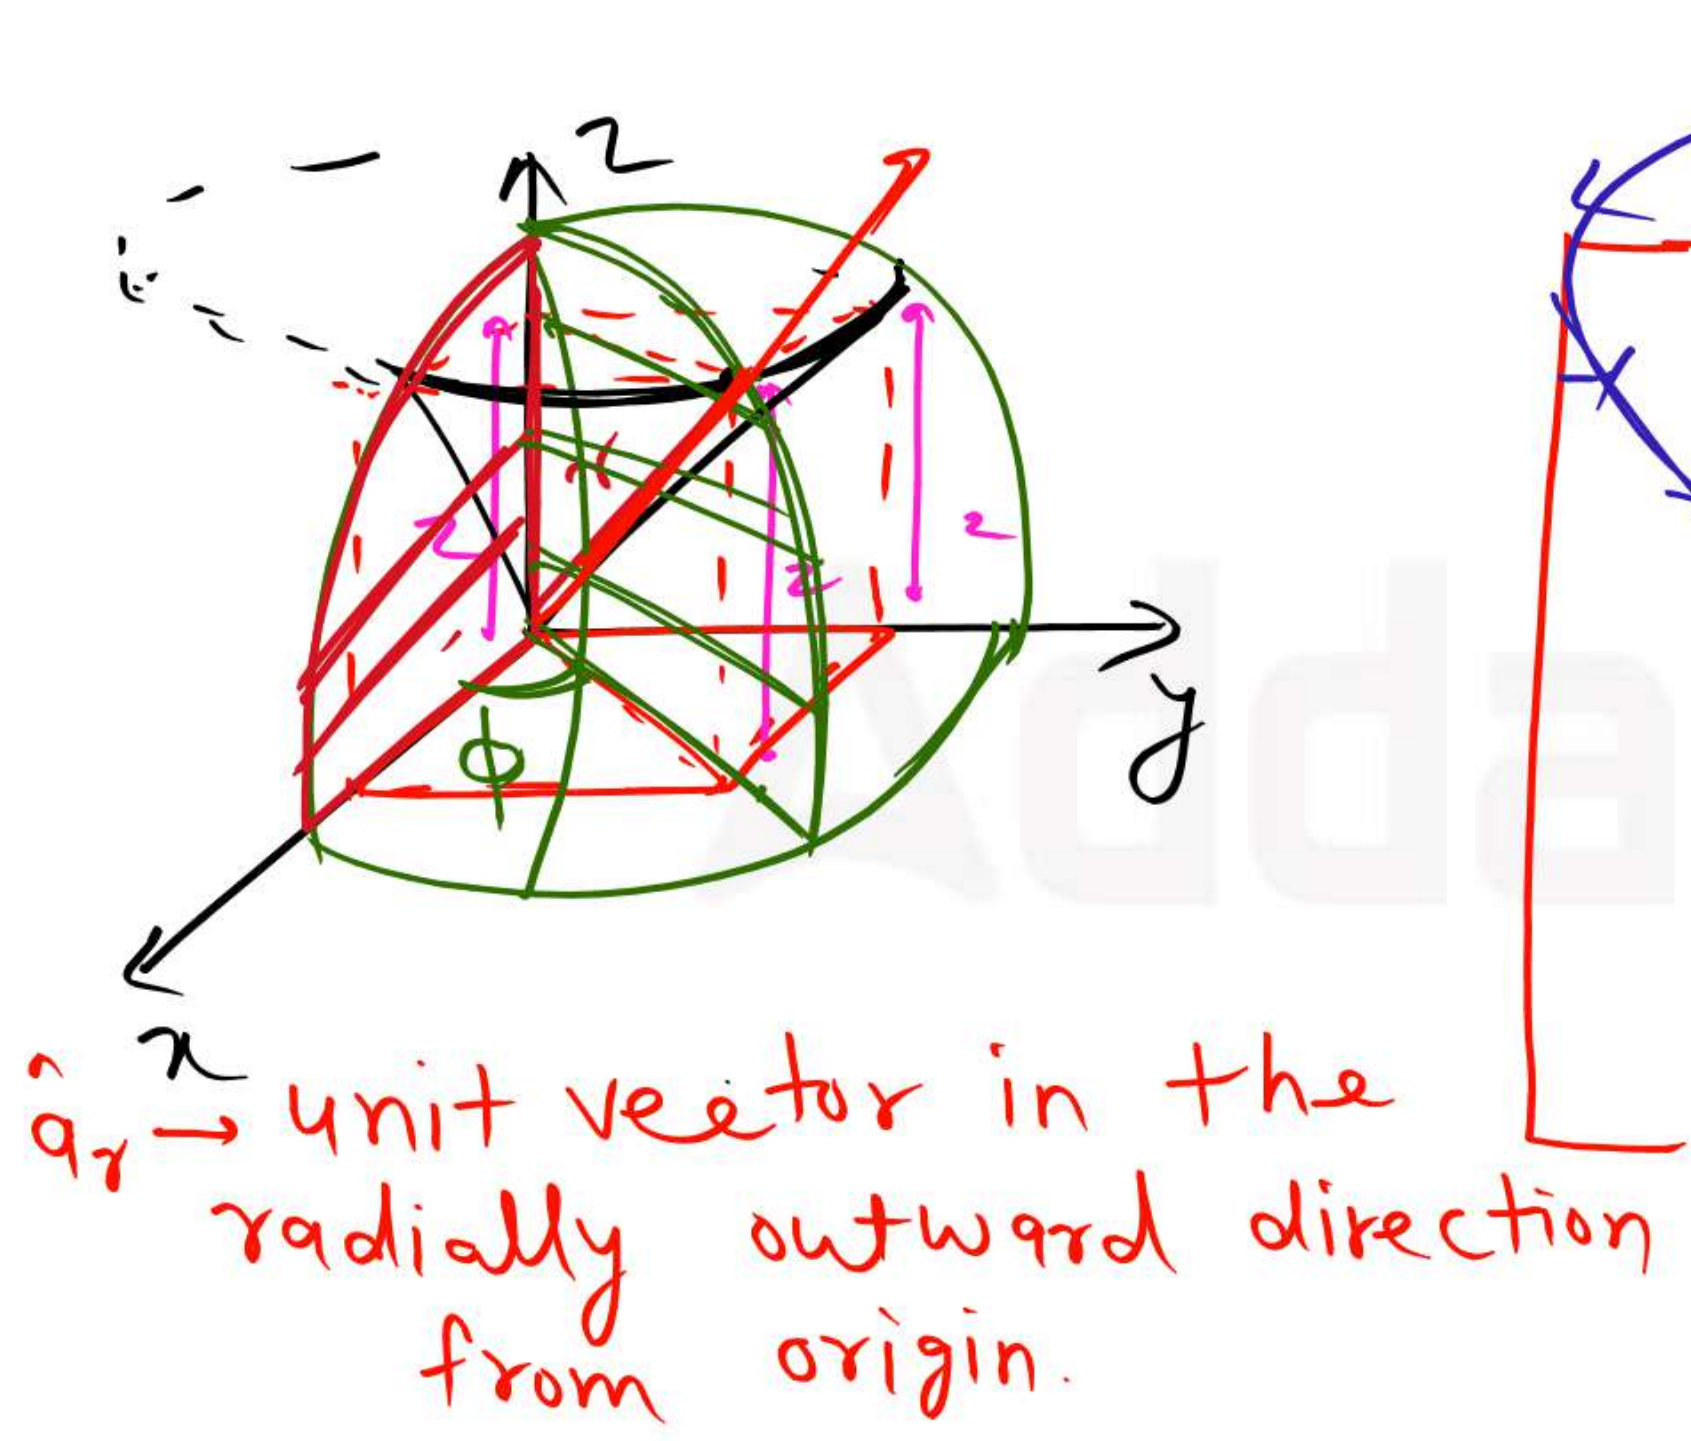

from +z axis always

Φ = azimuthal angle, angle of azimuthal plane from XZ-plane

$$0 \leq \Phi \leq 2\pi$$

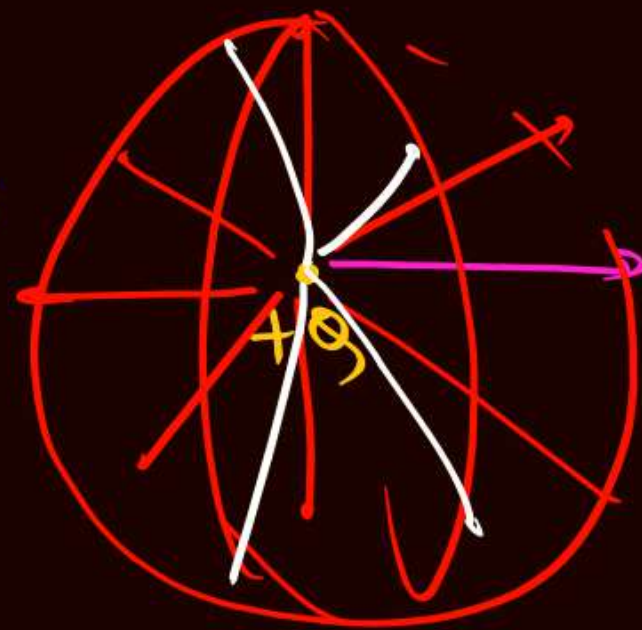

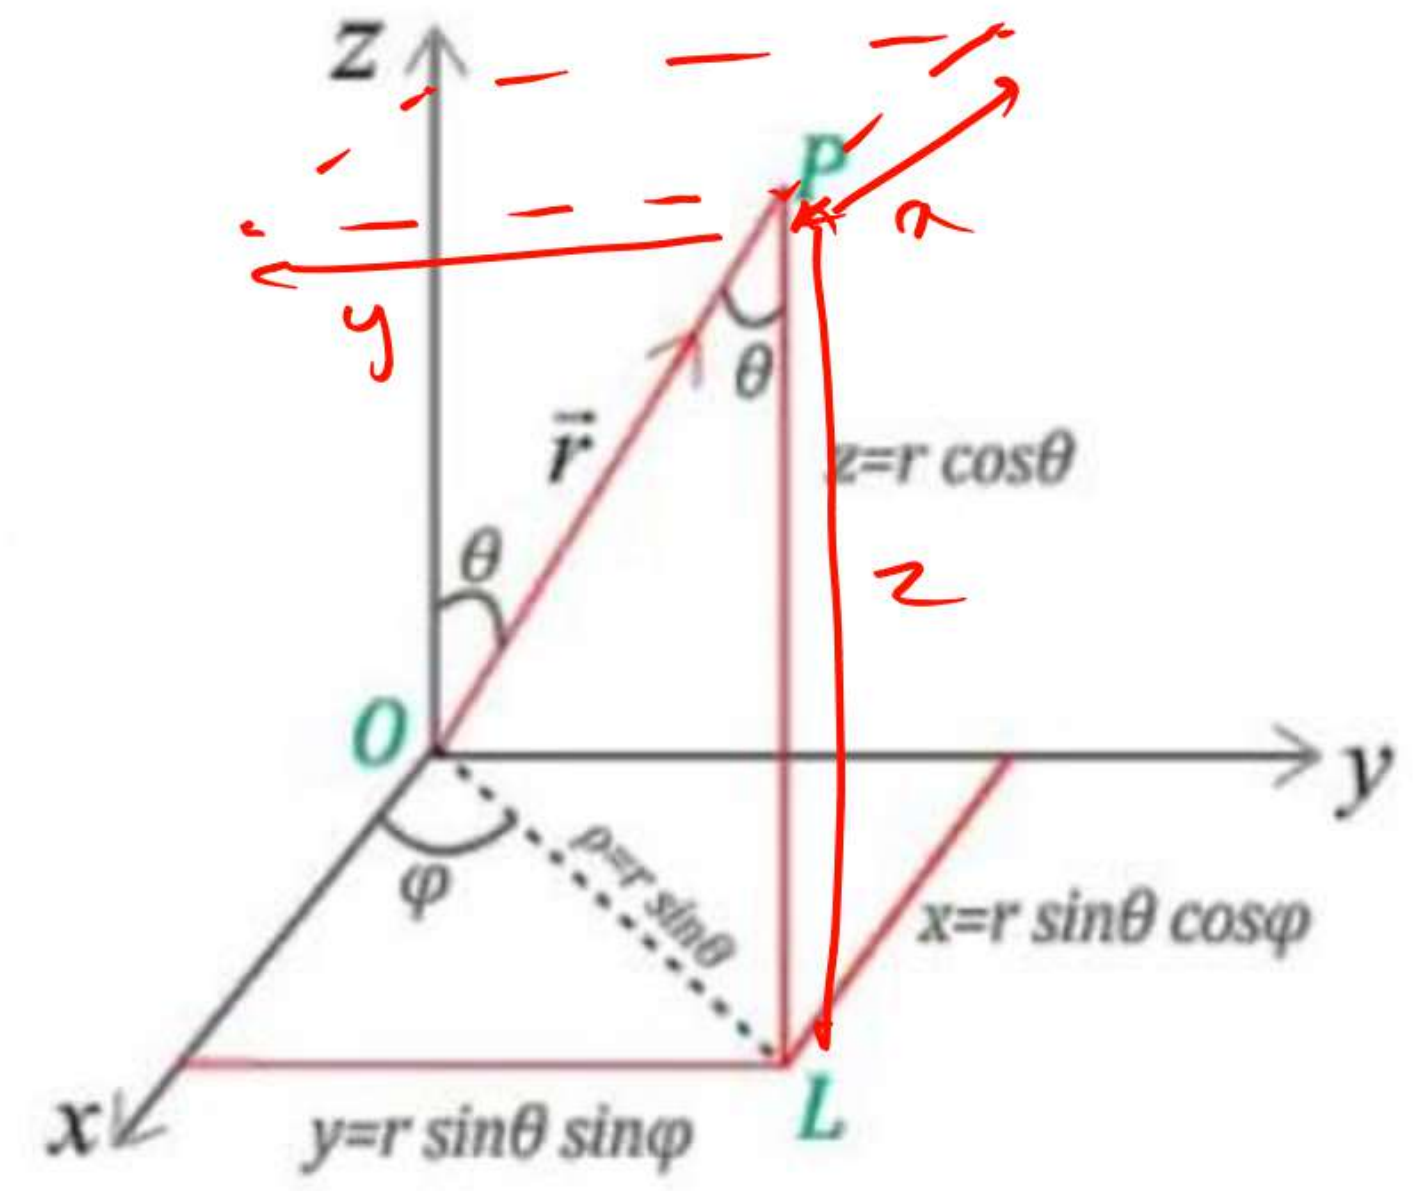

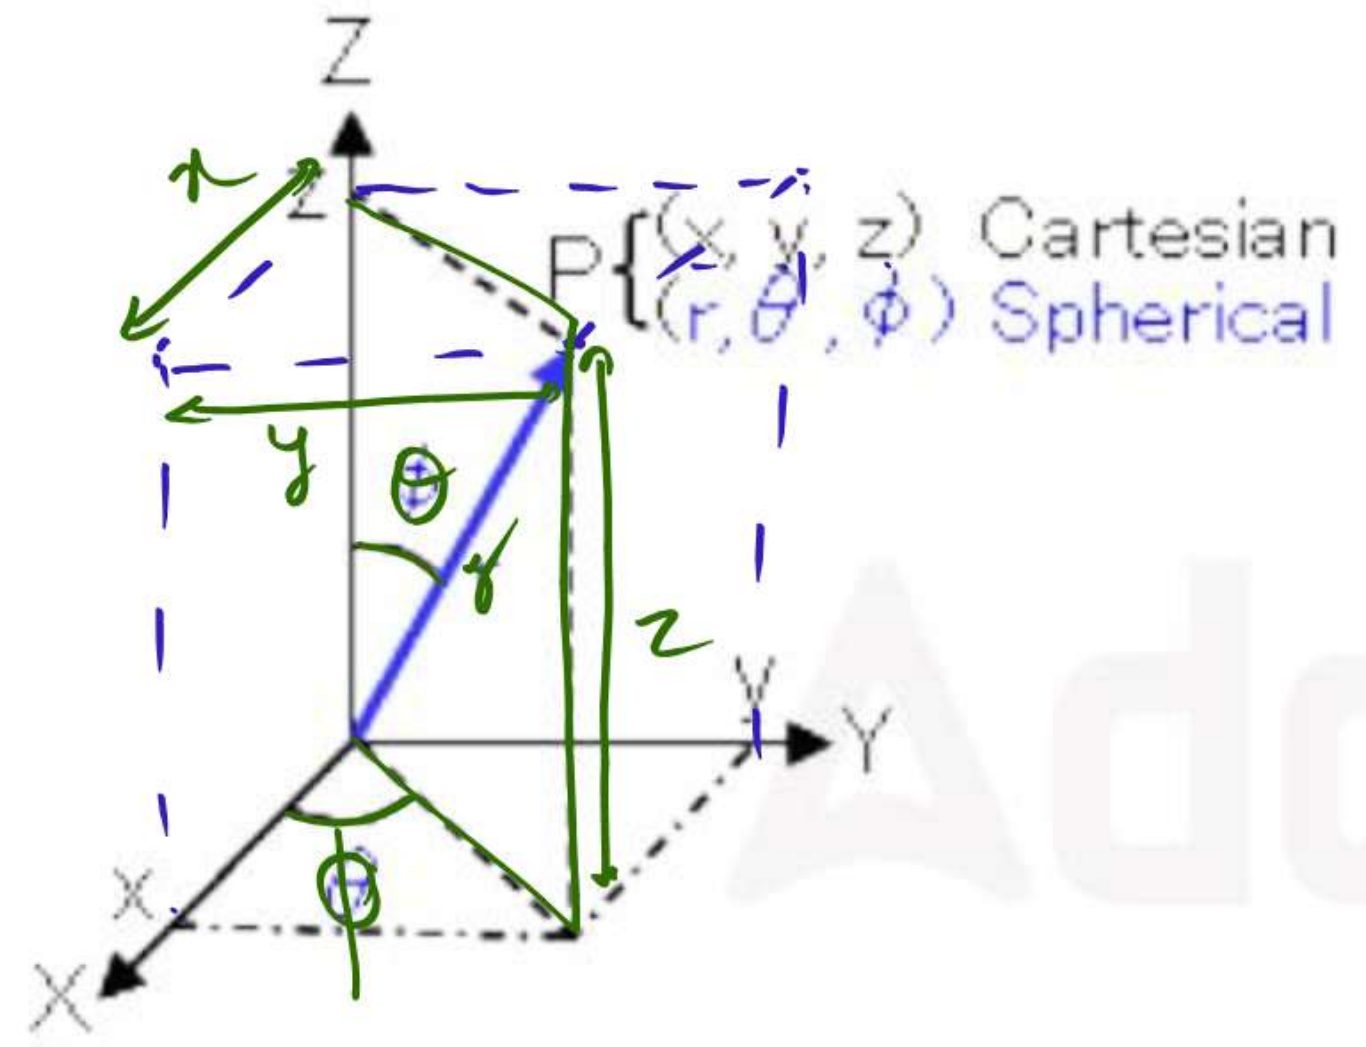

$\hat{a}_\theta \rightarrow$ unit vector in semicircular rotation around origin.

$\hat{a}_\phi \rightarrow$ unit vector in circular rotation around z-axis.

$$\vec{H} = -\frac{\partial \psi}{\partial \phi} \hat{a}_\phi$$

Spherical to Cartesian Conversion

$$P(\underbrace{\gamma}_r, \underbrace{\theta}_\theta, \underbrace{\phi}_\phi) \longrightarrow P(x, y, z)$$

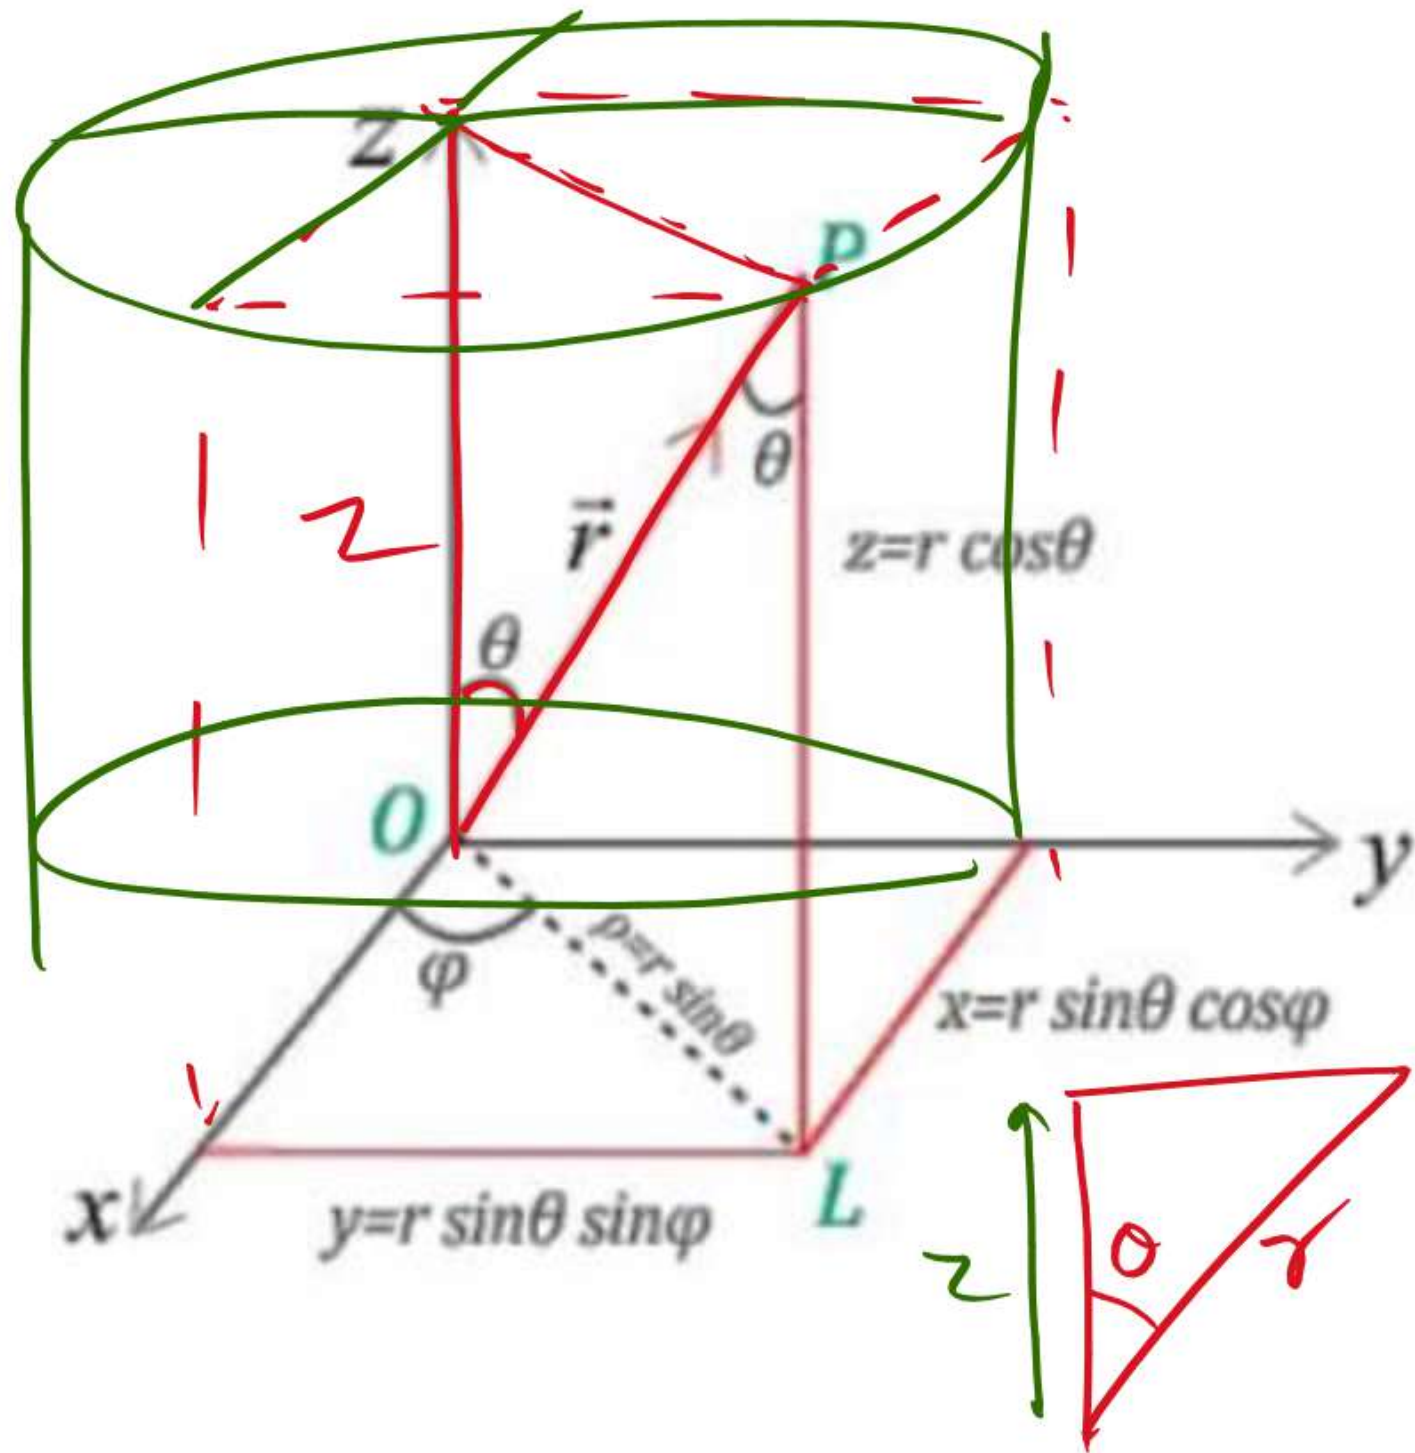

$$x = r \sin \theta \cos \phi$$

$$y = r \sin \theta \sin \phi$$

$$z = r \cos \theta$$

Spherical to Cylindrical Conversion

$$P(\underline{r}, \underline{\theta}, \underline{\phi}) \longrightarrow P(\underline{\rho}, \underline{\phi}, \underline{z})$$

$$\rho = r \sin \theta$$

$$\phi = \phi$$

$$z = r \cos \theta$$

Cylindrical to Spherical Conversion

$$P(\rho, \phi, z) \longrightarrow P(r, \theta, \phi)$$

$$r = \sqrt{\rho^2 + z^2}$$

$$\theta = \tan^{-1}\left(\frac{\rho}{z}\right)$$

$$\phi = \phi$$

$$\begin{aligned}
 x &= \rho \cos \phi \\
 y &= \rho \sin \phi \\
 z &= z
 \end{aligned}$$

$$\begin{aligned}
 x &= r \sin \theta \cos \phi \\
 y &= r \sin \theta \sin \phi \\
 z &= r \cos \theta
 \end{aligned}$$

$$\begin{aligned}
 \rho &= \sqrt{x^2 + y^2} \\
 \phi &= \tan^{-1}\left(\frac{y}{x}\right) \\
 z &= z
 \end{aligned}$$

$$\begin{aligned}
 r &= \sqrt{x^2 + y^2 + z^2} \\
 \theta &= \tan^{-1}\left(\frac{\sqrt{x^2 + y^2}}{z}\right) \\
 \phi &= \tan^{-1}\left(\frac{y}{x}\right)
 \end{aligned}$$

$$\rho = \sqrt{x^2 + y^2}$$

$$\phi = \tan^{-1}\left(\frac{y}{x}\right)$$

$$z = z$$

$$\rho = r \sin \theta$$

$$\phi = \phi$$

$$z = r \cos \theta$$

$$r = \sqrt{\rho^2 + z^2}$$

$$\theta = \tan^{-1}\left(\frac{\rho}{z}\right)$$

$$\phi = \phi$$

Q.10 Find cylindrical coordinates for the point $(0, -1, 3)$ written in Cartesian coordinates.

$$P(0, -1, 3) \longrightarrow P(\rho, \phi, z)$$

$$\rho = \sqrt{x^2 + y^2} = 1$$

$$\phi = \tan^{-1}\left(\frac{|y|}{|x|}\right) = 360^\circ - \tan^{-1}(\infty) = 270^\circ \text{ or } -90^\circ$$

$$z = 3$$

Q:1 Consider the surface described in Cartesian coordinates by

$$2z^2 = x^2 + y^2.$$

Describe this surface with an equation in cylindrical coordinates, of the form $f(\rho, \phi, z) = 0$.

$$2z^2 = x^2 + y^2$$

$$f(\rho, \phi, z) = 0$$

$$x = \rho \cos \phi$$

$$y = \rho \sin \phi$$

$$z = z$$

$$2z^2 = x^2 + y^2$$

$$2z^2 = \rho^2 \cos^2 \phi + \rho^2 \sin^2 \phi$$

$$2z^2 - \rho^2 = 0$$

$$f(\rho, \phi, z) = 2z^2 - \rho^2 = 0$$

Problem. 12 Find the Cartesian coordinates of each point, given in cylindrical coordinates.

① $(r, \theta, z) = (1, 1, 1)$

(ρ, ϕ, z) / $x = \rho \cos \phi$, $y = \rho \sin \phi$, $z = z$

$(x, y, z) =$?

② $\rho = 1$
 $\phi = 1 \text{ radian}$
 $z = 1$
 $(r, \theta, z) = (\pi, \pi, \pi)$

$x = \pi \cos \pi = -3.14$
 $y = \pi \sin \pi = 0$
 $z = \pi = 3.14$

$(x, y, z) =$?

③ $(r, \theta, z) = (2, 4\pi/3, -2)$

$x = 2 \cos\left(\frac{4\pi}{3}\right) = -\sqrt{3}$
 $y = 2 \sin\left(\frac{4\pi}{3}\right) = -1$
 $z = -2$

$(x, y, z) =$?

Problem. 13 Find the cylindrical coordinates of each point, given in Cartesian coordinates.

① $(x, y, z) = (1, 1, 1)$

$$\rho = \sqrt{x^2 + y^2} = \sqrt{2}$$

$$\phi = \tan^{-1}(1) = \frac{\pi}{4}, z = 1$$

$$(\rho, \phi, z) = \left[\sqrt{2}, \frac{\pi}{4}, 1 \right] ?$$

② $(x, y, z) = (\pi, \pi, \pi)$

$$\rho = \sqrt{\pi^2 + \pi^2} = \sqrt{2} \pi$$

$$\phi = \frac{\pi}{4}$$

$$(\rho, \phi, z) = \left[\sqrt{2} \pi, \frac{\pi}{4}, \pi \right] ?$$

③ $(x, y, z) = (2, 2\sqrt{3}, -2)$

$$\rho = \sqrt{4 + 12} = 4$$

$$\phi = \tan^{-1}(\sqrt{3})$$

$$(\rho, \phi, z) = \left[4, \frac{\pi}{3}, -2 \right] ?$$

Q:14 Find the Cartesian coordinates of the point $(2, \pi, \pi/2)$ given in spherical coordinates.

$$\rho = 2$$

$$\theta = \pi$$

$$\phi = \frac{\pi}{2}$$

$$x = \rho \sin \theta \cos \phi = 2 \sin \pi \cos \left(\frac{\pi}{2} \right) = 0$$

$$y = \rho \sin \theta \sin \phi = 2 \sin \pi \sin \left(\frac{\pi}{2} \right) = 0$$

$$z = \rho \cos \theta = 2 \cos (\pi) = -2$$
